Pollinator®

The Pollinator® is an automatic dry sift system. Dried plant material tumbles in a screen-covered drum - trichomes pass through and can be easily collected.

Our standard Pollinator® screen size is 150 µm, suitable for most types of plant material.

For custom screens (e.g. 185 µm, 120 µm, 90 µm etc), please simply get in touch.

Please note:

- We can equip every Pollinator® Drum with the screen size of your choice (185 µm, 120 µm, 90 µm etc). Please simply contact us directly for custom machines/drums.
- Due to the fact that every Pollinator® is hand made in our small manufacture in Amsterdam, delivery of large orders may require 2-3 weeks after payment was completed and received.

Ice-O-Lator®

220 micron (µm) is a filter and allows all resin glands to pass through while retaining leaf material;
 185 µm can be used as a primary filter for material with overall small resin glands (e.g. outdoor), or as secondary filter;
 120 µm can be used as a further filter or to catch the very largest glands, depending on the plant material;
 90 µm catches only large glands (aka "supersized crystals");
 70 µm catches larger, mature glands - it is ideal for overall larger crystal sizes (e.g. indoor material);
 45µm catches all larger and intermediate glands - it is ideal for overall smaller crystal size (e.g. outdoor material);
 38 µm catches small glands (aka "mini crystals");
 25 µm catches even the smallest of glands (aka "super-mini crystals), but may contain plant debris.
